

Xspread

The Xspread is another product from the Xfarm stable that conforms to the philosophy of “Simply Precise”. Besides being manufactured to stringent quality and precision standards, it simply does the job precise and accurate. Lime, gypsums, chicken manure and fertilizers are spread evenly across the full spread width.

- This precision is obtained by the positioning of the spinners and the shape of the spinner flights. The unique design of the flights projects the product horizontally rather than laterally which enhances the spreading width whilst the effect of wind on the spreading pattern is minimized.
- Productivity is notably improved by the increased spread width, capacity, auto-calibration and effectivity of the spread.
- Steep bin sides ensure consistent flow of the product unto the conveyor. Manure compounds can easily be spread.
- Round bar screens are standard on all spreaders to prevent stones from entering the bin that can cause blockages at the gate or damage to the spinners.

Xspread

THE FEED

Control of the left and right conveyor allows for section control. The slatted chain conveyor is housed in a removable cassette. A cassette with rubber belt conveyors can be installed should belts better suit the product and application style. An adjustable gate allows for fine adjustment and accurate calibrations.

THE LOAD

Leaf-spring axle suspension and a rubber-cushioned drawbar, not only enhances equipment life, but is vital to stable and accurate weight determination. This greatly contributes to precise calibration on the go.

THE SPEED

Suspension also allows for greater speeds to get the job done faster. Together with wide flotation tyres, a softer ride eliminates compacting of the soil which is vital to sustainable cropping.

THE SPREAD

The point at which the product is released on the spinner determines the evenness and width of the spread. Fully adjustable spinners make it possible to obtain the least amount of variance over the spread width.
